

Mirapoint: Anti-Virus

The Most Effective Anti-Virus Solution

Don't Settle for an Inferior Virus Defense

With the typical infection costing an organization \$500,000 per incident, email-borne viruses and inadequate protection against them, can wreak havoc on your company and cause losses in data, productivity and profitability.

Get the Industry's Leading Edge Solution with Mirapoint

Mirapoint appliances offer a turnkey anti-virus solution that will give your company best-of-breed protection to manage virus threats for incoming and outgoing message traffic. Automatic updates are available to provide protection from the latest, emerging virus outbreaks. Mirapoint's excellent virus scanning technology has been recognized and certified by TruSecure ICSA Labs, West Coast Labs, Virus Bulletin, and other independent testing bodies.

Superior Features and Benefits

Integrated Anti-Virus and Message Processing: Anti-virus protection is available in every Mirapoint appliance including the Message Server and RazorGate appliances. Mirapoint tightly integrates anti-virus scanning technology into its Message Transfer Agent (MTA) to provide superior performance and unified management with other elements of the Mirapoint appliance. This integrated virus scanning technology is an excellent complement to Mirapoint's MailHurdle™ technology, which drops up to 80% of threats at the network edge before network bandwidth, storage, processor and administrator resources are wasted.

Easy Management & Administration: To reduce costs and ease administration, virus protection can be quickly enabled on any existing Mirapoint appliance simply by installing a license key. Mirapoint's anti-virus technology can be easily managed through a web browser, command-line, or Mirapoint's Administration Protocol. Administrators have flexible message handling options available to determine how viruses should be handled, including cleaning, deleting, tagging or delivering as normal. Notifications can also be sent to the message sender, recipient and the administrator if a virus is detected.

Anti-Virus Updates and Support: For the latest and greatest protection, virus identity (IDE) file updates can be automatically pushed over the network to Mirapoint appliances. These can also be updated hourly, daily, weekly, monthly, or on-demand by the administrator. Notifications of emerging virus threats are sent on a regular basis from Mirapoint to its customers, and include a detailed description of the new virus threats. Furthermore, with Mirapoint's integrated appliance approach, Mirapoint directly supports the entire solution including the anti-virus technology.

Class-of-Service Controls: Every Mirapoint appliance offers class-of-service controls that define access for individual users or domains to various features in the system, including virus filtering. These class-of-service settings can be stored on the Mirapoint system or in a Lightweight Directory Access Protocol (LDAP) server. For example, service providers and educational institutions frequently use this feature for defining billable service packages or tailoring functionality for specific users in a diverse environment.
